

Self-contained toilets are all-in-one units that **do not require underfloor clearance**. Perfect for tiny houses built on concrete slabs, camper vans and boats.

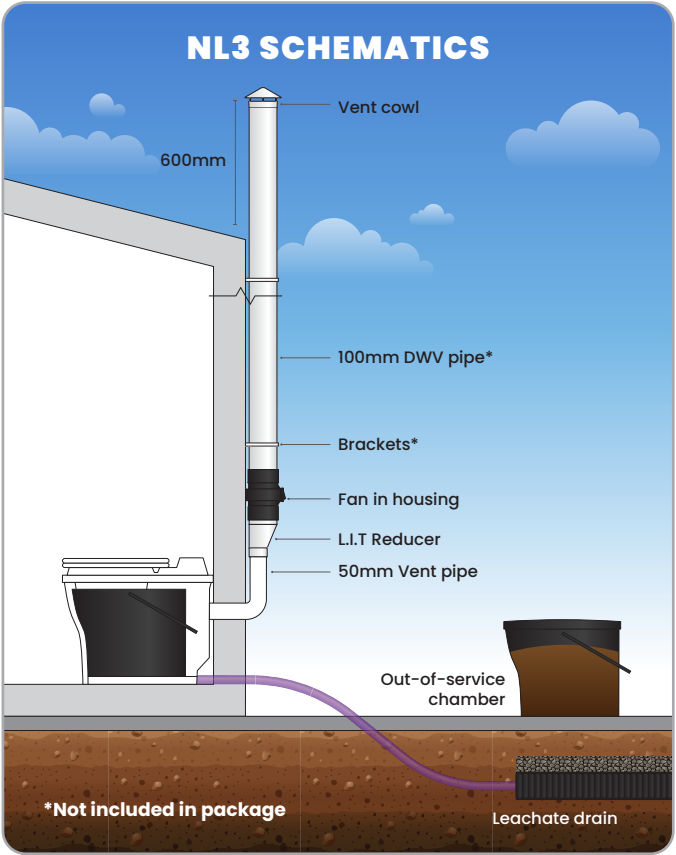

The solids chamber is positioned within the pedestal, hence the name “self-contained”.

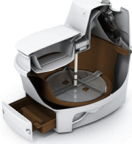

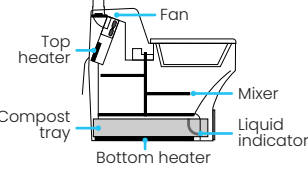

Our two main types of waterless self-contained toilets are:

- Composting
- Collection (other side of flyer)

Not all self-contained toilets are composting toilets, particularly the small ones with urine diversion. As they usually would have small solids chambers that would need to be emptied more frequently compared to larger toilets, not allowing enough time for the waste to be compost between emptying intervals. Waste may emptied into an external chamber to complete composting.

Approx. Emptying Intervals 2 Users	Swap the chambers about every 2 months or once full	The general rule is to empty the tray when the compost pile reaches the upper mixing arm, or every 12 weeks.	
Starter Pack	Bulking agent, microbes, enzymes with spray bottle	Bulking agent, microbes, enzymes with spray bottle	
Incl. Vent Piping	A vent pipe kit can be purchased separately	Vent pipe kit included An optional wall kit is available to purchase separately	
Incl. Drain Kit	Hose included; leachate drain kit can be purchased separately	Optional: Liquid indicator hose can be converted into a drain hose	

SELF-CONTAINED WATERLESS TOILET SYSTEMS

COLLECTION – URINE DIVERSION

Urine-diverting toilets have a special urine basin at the front of the toilet bowl, which catches and diverts the urine. There are two main types of urine diversion toilet models – Container and Extraction.

Urine Container

With Container models, the urine is drained into an internal liquids tank.

Urine Extraction

With Extraction models, the urine is drained away to an external location such as a liquids tank or absorption trench.

Urine can be emptied into another toilet or at a dump point; or diluted and used as a fertiliser. Solid waste could either go directly into the solids chamber or into a bio bag to be easily removed and disposed of at a dump point.

Depending on environmental conditions, waste needs around 3–6 months to compost. If you're interested in turning waste from your self-contained toilet into a fertiliser, we recommend emptying the solids chamber into an external chamber to set aside and finish composting.
